

# Improving and Measuring Outcomes

## Early Intervention in Psychosis

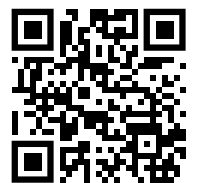

**DIALOG+** is an approach that provides assessment, planning, intervention and outcome measurement all in one procedure.

### Once the rating scale is complete, you can:

- ✓ **Ask** the individual to select their priorities/main concerns
- ✓ **Understand** each problem and emphasise successful ways of coping
- ✓ **Identify** the 'best case scenario' and small steps forward
- ✓ **Explore** options for what they, the team and others can do
- ✓ **Agree actions** – and review at next session!

Reviewing a young person's goals and needs every 4 to 6 months is proven to promote recovery.
